Description

Isolate highly purified peripheral blood mononuclear cells (PBMCs) directly from leukapheresis samples by immunomagnetic negative selection. This kit can also be used to isolate PBMCs from other sample types (see Table 1).

- 99.9% RBC depletion without the need for density gradient centrifugation, sedimentation or lysis
- Fast, easy-to-use and column-free
- Isolated cells are untouched

This kit targets granulocytes, platelets, and red blood cells (RBCs) for removal with antibodies recognizing specific cell surface markers. Unwanted cells are labeled with antibodies and magnetic particles, and separated using an EasySep™ magnet. PBMCs are simply collected into a new tube and are immediately available for downstream applications such as flow cytometry, culture, or DNA/RNA extraction.

- This is the Product Information Sheet (PIS) for isolating PBMCs from leukapheresis samples. If isolating PBMCs from other sample types, refer to the applicable PIS Document Number (see Table 1), available at www.stemcell.com or contact us to request a copy.

Sample Preparation

For available fresh samples, see www.stemcell.com/primarycells.

LEUKAPHERESIS

For best recovery, use an unprocessed leukapheresis pack. Recovery of the desired isolated cells decreases with samples that are older than 24 hours.

To avoid loss of monocytes, EDTA must be added to the leukapheresis sample to a final concentration of 6 mM prior to labeling and separation (see step 2, Tables 2 - 4). An EDTA stock solution greater than 0.05 M is recommended to avoid overdiluting the start sample.

Recommended Medium

EasySep™ Buffer (Catalog #20144), RoboSep™ Buffer (Catalog #20104), D-PBS (Without Ca++ and Mg++; Catalog #37350), or PBS containing 2% FBS and 1 mM EDTA. Medium should be free of Ca++ and Mg++.

Directions for Use – Manual EasySep™ Protocols

See page 1 for Sample Preparation and Recommended Medium. Refer to Tables 2 and 3 for detailed instructions regarding the EasySep™ procedure for each magnet.
